Preliminary remarks and calculation principles

Area of application

The Sikla “Static Guideline” for the siMetrix 46 fastening system allows the user to easily select and plan supporting structures. It provides permissible load-bearing capacities of typical Sikla structures.

Basis and calculation principles

The design of typical Sikla structures in the ultimate limit states and serviceability limit states is based on Eurocode 0 and 3, *DIN EN 1990:2021-10*, as well as *DIN EN 1993-1-1:2010-12* and the national annex *DIN EN 1993-1-1 NA* and *DIN EN 1993-1-3:2010-12* and *DIN EN 1993-1-3 NA-2017- 05*.

For the **ultimate limit state (ULS)**, the characteristic values of the load capacity of the components are reduced with a partial safety factor γ_{M2} = 1.25 according to Chapter 6.1 „General“, *DIN EN 1993-1-1:2010-12*.

The **ultimate limit states in the STR/GEO** category are verified according to *DIN EN 1990:2021-10*, Chapter 6.4 „Ultimate limit state“, according to equation 6.8: $E_d \leq R_d$.

The combination of actions in permanent or temporary design situations (basic combination) according to *Chapter 6.4.3.2, formula (6.10)* forms the basis for the verification.

The partial safety factors $\gamma_{G,j}$ for the permanent actions and $\gamma_{Q,i}$ for variable actions, as well as the combination values $\psi_{0,i}$ are taken from Table A2..4(B) - Design values of the actions (STR/GEO) - Group B.

The following applies:

- Static permanent loads G such as pipeline weights are assigned a partial safety factor γ_G = 1.35
- Variable loads Q such as additional friction forces $F_x = F_z * \mu_{Frict.}$ for Sikla pipe supports on the zinc-magnesium surface of the siMetrix profiles, which are calculated from the pipe weight Fz and a static friction coefficient $\mu_{Frict.}$ = 0.20 (Sikla sliding element and pipe shoe). These variable forces from the pipe expansion are assigned a partial safety factor γ_Q = 1.5.

Guided bearings with static friction coefficients $\mu_{Frict..} > 0.2$ require separate design.

The verification of the **serviceability limit states (SLS) in the STR/GEO** category is carried out in accordance with *DIN EN 1990:2021-10*, Chapter 6.5 „Serviceability limit state“, according to the equation: $E_d \leq C_d$, where C_d is the design value of the limit state for the relevant serviceability criterion.

For the Sikla structures, the serviceability criterion is deflection and deformation. Here the verification is carried out on the basis of the characteristic combination (6.14 b) in Chapter 6.5.3 „Combination of actions“. In this equation, the partial safety factors are assumed to be 1.0.

Permissible loads

The specified permissible loads correspond to the maximum characteristic permanent loads G_k and variable loads Q_k, taking into account the ultimate limit states and serviceability for the respective structure.

The influence of the connections on the ultimate limit states and serviceability limit states is taken into account in the static models by accounting for the load capacities and spring properties of the corresponding components in the calculations.

The values of the permissible loads therefore simultaneously fulfill the proof of ultimate capacity and the proof of serviceability. The relevant case in each case is listed as $F_{z,\,perm}$.

10/2024

Connection to existing on-site structures

When fastening using anchors or connecting to existing anchor rails, the load-bearing safety proof for the products used for this purpose must be provided separately. When connecting to existing steel structures on site, its load-bearing capacity as well as its load-bearing and torsional rigidity must be tested separately. In addition, when assembling the structures using clamps, it must be ensured that the static friction between the connection set and the on-site support meets the condition $\mu_{Frict.} \geq 0.2$ (sliding surface class D).

Unless otherwise stated, the following applies:

- Force direction F_x = longitudinal axis of the support.
- Connections to concrete are dimensioned with dowel type Bolt Anchor AN BZ plus M10 hef. 60 (ETA-10/0259) in concrete strength C20/C25 under the structural specifications $h_{min} \geq 1.5\ h_{ef}$ and edge distance $c \geq 120$ mm.
- Axial distances are specified by the components.

Technical information

The boundary conditions for assembling the structures are compiled in the document “siMetrix Installation Guidelines” - in particular specifications for tightening torques, screw spacing, etc.

The technical information in the respective product data sheets regarding use and application must be observed.
The indicated load values also apply when using unperforated profiles.

siMetrix Installation Guidelines

Reusability of products

Products may only be reused if the specified permissible load specifications have not been exceeded and the surface protection is not damaged

Exclusion of liability

This documentation is intended for the use of the recipient only and is the property of Sikla in all its parts. The technical images and all information are provided to the best of our knowledge.
Illustrations and drawings are non-binding. Liability for printing errors is excluded.
We reserve the right to make changes and design improvements, particularly in the interests of technical progress.

2 Point Loads

	Load directions Z and X					
L_{max} / H_{max}	250		500		750	
	$F_{z, perm}$	$F_{x, perm}$	$F_{z, perm}$	$F_{x, perm}$	$F_{z, perm}$	$F_{x, perm}$
[mm]	[kN]	[kN]	[kN]	[kN]	[kN]	[kN]
250	**1.10**	**0.22**	**0.55**	**0.11**	**0.36**	**0.07**
500	**0.75**	**0.15**	**0.55**	**0.11**	**0.36**	**0.07**
750	**0.44**	**0.09**	**0.44**	**0.09**	**0.36**	**0.07**
1000	**0.30**	**0.06**	**0.30**	**0.06**	**0.30**	**0.06**

F_z [kN] as permanent loads at distance L.
F_x [kN] as variable loads at distance L.

3 Point Loads

	Load direction Z		
L_{max} / H_{max}	250	500	750
	$F_{z, perm}$	$F_{z, perm}$	$F_{z, perm}$
[mm]	[kN]	[kN]	[kN]
250	**1.41**	**0.82**	**0.54**
500	**1.41**	**0.81**	**0.54**
750	**1.41**	**0.81**	**0.54**
1000	**1.41**	**0.80**	**0.54**

F_z [kN] as permanent loads at distance L and L/2.

3 Point Loads

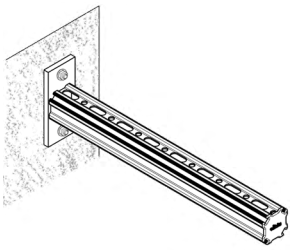
	Load directions Z and X					
L_{max} / H_{max}	250		500		750	
	$F_{z, perm}$	$F_{x, perm}$	$F_{z, perm}$	$F_{x, perm}$	$F_{z, perm}$	$F_{x, perm}$
[mm]	[kN]	[kN]	[kN]	[kN]	[kN]	[kN]
250	**1.10**	**0.22**	**0.55**	**0.11**	**0.36**	**0.07**
500	**0.50**	**0.10**	**0.50**	**0.10**	**0.36**	**0.07**
750	**0.30**	**0.06**	**0.30**	**0.06**	**0.30**	**0.06**
1000	**0.20**	**0.04**	**0.20**	**0.04**	**0.20**	**0.04**

F_z [kN] as a permanent loads at distance L and L/2.
F_x [kN] as variable loads at distance L and L/2.

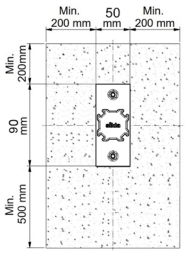
Standing installation only.
Friction coefficient μ_0 = 0.2 for friction in longitudinal direction. Max. deviation H/150 and L/150.
Use of the anchors must be taken into account according to local conditions.

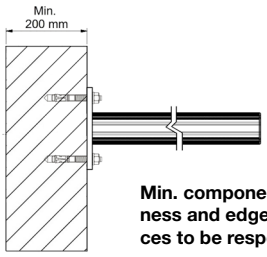
Working loads in accordance with Eurocode 3

Beam Bracket anchored



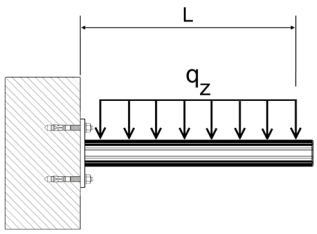
Part List
1x Cantilever Bracket AK 46-P
2x AN BZ plus M10 hef. 60 (Concrete C20/25)





Min. component thickness and edge distances to be respected

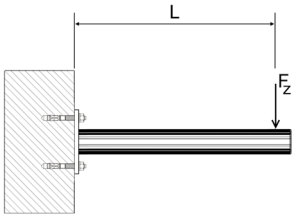
Distributed Load



Load direction Z		
L_{max}	$q_{z, perm}$	F_z (q_z * L)
[mm]	[kN/m]	[kN]
200	**14.71**	**2.94**
400	**4.29**	**1.71**
600	**1.73**	**1.04**
800	**0.89**	**0.71**
1000	**0.53**	**0.53**

q_z [kN/m] as permanent load at distance L.

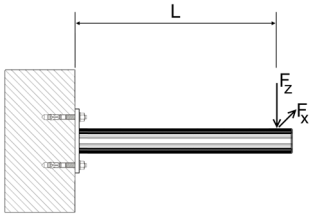
Point Load



Load direction Z	
L_{max}	$F_{z, perm}$
[mm]	[kN]
200	**1.84**
400	**0.80**
600	**0.48**
800	**0.32**
1000	**0.23**

F_z [kN] as permanent load at distance L.

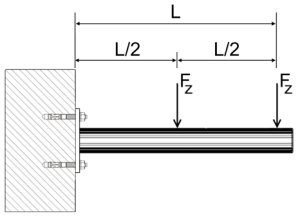
Point Load



Load directions Z and X		
L_{max}	$F_{z, perm}$	$F_{x, perm}$
[mm]	[kN]	[kN]
200	**1.59**	**0.32**
400	**0.78**	**0.16**
600	**0.48**	**0.10**
800	**0.32**	**0.06**
1000	**0.23**	**0.05**

F_z [kN] as permanent load at distance L;
F_x [kN] as a variable load at distance L.

2 Point Loads

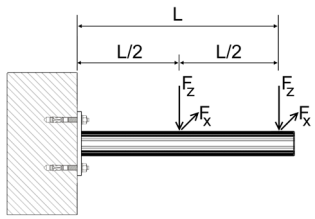


Load direction Z	
L_{max}	$F_{z, perm}$
[mm]	[kN]
200	**1.23**
400	**0.55**
600	**0.33**
800	**0.22**
1000	**0.16**

F_z [kN] as permanent loads at distance L and L/2.

10/2024

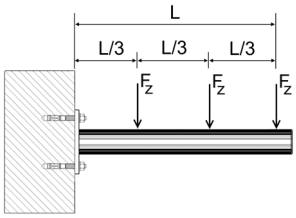
2 Point Loads



Load directions Z and X		
L_{max}	$F_{z, perm}$	$F_{x, perm}$
[mm]	[kN]	[kN]
200	**1.06**	**0.21**
400	**0.52**	**0.10**
600	**0.33**	**0.07**
800	**0.22**	**0.04**
1000	**0.16**	**0.03**

F_z [kN] as permanent loads at distance L and L/2
F_x [kN] as variable loads at distance L and L/2.

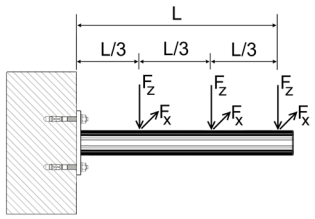
3 Point Loads



Load direction Z	
L_{max}	F_z (q_z * L)
[mm]	[kN]
200	**0.90**
400	**0.42**
600	**0.25**
800	**0.17**
1000	**0.13**

F_z [kN] as permanent loads at distance L, 2L/3 and L/3.

3 Point Loads



Load directions Z and X		
L_{max}	$F_{z, perm}$	$F_{x, perm}$
[mm]	[kN]	[kN]
200	**0.80**	**0.16**
400	**0.39**	**0.08**
600	**0.25**	**0.05**
800	**0.17**	**0.03**
1000	**0.13**	**0.03**

F_z [kN] as permanent loads at distance L, 2L/3 and L/3;
F_x [kN] as variable loads at distance L, 2L/3 and L/3.

Friction coefficient μ_0 = 0.2 for friction in longitudinal direction. Max. deviation L/100.

Load values also valid with the following anchors:
VMU plus + VMU-A (5.8) M10
VMZ + VMZ-A 60 M10
